

ABSTRACT OF THE DISCLOSURE

A windshield washer fluid reservoir tank for a vehicle is externally formed with a side stepping surface, and is internally defined with a space for storing windshield washer fluid replenished through a feeding pipe having a cap, and for allowing the windshield washer fluid stored therein to be pumped to a windshield of the vehicle through supply hoses under the operation of a supply motor pump installed in position within the windshield washer fluid reservoir tank, in order to ensure extended use of the windshield washer fluid without requiring frequent replenishment, by virtue of such a space having a sufficient storage capacity capable of storing a large amount of the windshield washer fluid.
